

Lab 0 - Your first program in Visual Studio: to do

- Task 1 - Print your name and student number assessed
- Change the two lines to your own name and student number, run it
- Screenshot your whole window - the program in the editor, its output in front
- Save it as Lab0_<your student number>.png and submit it before Lab 1

Build and run: three ways, keep yours

Each folder is one program - every `.cpp` in it, built together - with a Visual Studio `.sln` and a `CMakeLists.txt`. Delete what you do not use. `expected.txt` is what the program prints.

- **Visual Studio** - double-click the `.sln`, then **Ctrl+F5**. Asked whether you trust the project: yes.
- **VS Code or CLion** - open the folder that holds `CMakeLists.txt` and run. In a terminal:
`cmake -S . -B build -G Ninja`, then `cmake --build build`, then
`.\build\<folder name>.exe`.
- **g++** - in a terminal, in the folder: `g++ -std=c++20 -Wall -Wextra -static *.cpp -o app`, then
`.\app.exe`.

A task project

1. **Visual Studio** - File > New > Project > **Empty Project** (C++) > Next. Name `TaskN`, location your `Lab0_<student number>` folder, tick *Place solution and project in the same directory*, Create. Right-click *Source Files* > Add > New Item for a `.cpp`; *Header Files* for a `.h`, and replace its `#pragma once` with the `#ifndef` guard. Project > Properties > *All Configurations* > C/C++ > General > Warning Level > **Level4 (/W4)**. Ctrl+F5.
2. **VS Code or CLion** - copy a sample's `CMakeLists.txt` into your `TaskN` folder and change the name in `project(...)` to `TaskN`.
3. **g++** - the same command as above, in your `TaskN` folder.
4. **First error** - fix the top one only, build again.

In this folder

`Hello` - one complete program each, as printed in the Lab 0 manual.
